Vetreal Sano Chicken Supplementary Feed for Poultry

Vetreal Sano Chicken is a new supplementary feed for the natural protection of poultry health. The physiological bodily functions of animals work like a finely tuned machine. If something fails or the system is not lubricated, then the whole machine begins to splutter, i.e. in terms of animals, the risk of illnesses increases.

For the first time, V-S-Chicken offers the opportunity of natural and effective protection of health, completely chemical-free. Using this targeted supplementary feed with V-S-Chicken, the immune system of the animals is provided with all the components they need to react rapidly to illnesses. As a result, the animals are protected against unforeseen stresses and excessive susceptibility to illness.

In order to maintain health, all the body's own regulatory procedures must be maintained or re-adjusted. V-S-Chicken makes this possible with its dynamic active ingredients. The aim of supplementary feeding with V-S-Chicken is to maintain and recover the body's own biological balance – the so-called homeostasis (self-regulation).

What does Vetreal Sano Chicken contain?

V-S-Chicken is made up of inactive probiotic, prebiotic and vegetable components together with valuable natural amino acids and vitamins. Despite its low dose, this biological diversity ensures the complicated physiological machine functions flawlessly.

This diversified, dynamic multicomponent mixture meets the high demands for health and performance-oriented metabolism. The tessellated composite combination found in V-S-Chicken is far superior to the use of individual agents that was previously usual. Constant feeding with this dynamic multicomponent mixture meets today's high performance requirements. As a result, the "machine" does not begin to "splutter" when there is an unexpected production stress. Using this process of normalisation, you will save a lot of time and money.

Where does Vetreal Sano Chicken have an effect?

The most important metabolism centres such as the alimentary canal, the liver, the immune system, the nerves and cardiovascular system must be constantly "fed" with V-S-Chicken in order to ensure health. These important ingredients found in V-S-Chicken are largely missing in today's computer-controlled nutritional calculations.

Vetreal Sano Chicken closes these gaps

However, comprehensive health provision must also take into account extreme environmental factors as part of the solution to the problem. Hygiene, climate, management and other factors are part of the programme of looking after livestock as many of these environmental factors form the basis of an illness or at least account for the sensitive machine running irregularly.

Advantages gained through Vetreal Sano Chicken

- higher live weight
- higher meat yield
- higher proportion of top-quality meat
- very low mortality rate
- considerably better marginal return per animal
- lower feed conversion index (kg feed per kg weight increase) = good feed conversion
- lower liver and spleen weights (index for less strain)
- lower immunoglobulin values (confirmed "de-stressing" factors)
- considerably less moisture and incrustation of litter
- low level dosages

VETREAL SANO CHICKEN

Art. 8000010

Delivery in 25 kg sacks

INGREDIENTS

Oatmeal, natural flavourings from herbs, probiotics (inactive), prebiotics

DOSE

0.2–0.4% in the complete feed
